

Tips for Staying Hydrated

Tips for Staying Hydrated

As summer temperatures hit the higher numbers it is very important to stay hydrated. Your body is designed to sweat, which allows the skin to wick heat from your body. Staying hydrated helps the body produce more sweat and keep the body cool, keeping you safer in the heat. **Remember: One of the best defenses against heat-related illnesses and injuries is prevention.**

Here are a few simple things you can do to stay hydrated:

- Begin your day well-hydrated. Drink plenty of fluids the day before, during, and after your workday. Remember that coffee is a diuretic and will dehydrate your body.
- Avoid alcohol the day before working in excessive heat: Remember that hydration starts the night before.
- Drink enough water prevent thirst. If you're thirsty, you may have already lost about 2% of your body's fluids and it's time to replenish.
- For longer jobs that last more than two hours, drink electrolyte-containing beverages such as sports drinks. Electrolytes and carbohydrates help your body absorb whatever fluids you drink and give you a boost before, during, or after some time in the sun. We lose electrolytes when we sweat so it is wise to replenish them. A great alternative to sports drinks is coconut water, they both can be great options! You lose salt and other electrolytes when you sweat. Substantial loss of electrolytes can cause muscle cramps and other dangerous health problems.
- Monitor fluid loss by checking the color of your urine: It should be pale yellow, not dark yellow, and not too smelly or cloudy.
- Eat MORE fruit and veggies: 20% of your daily fluid intake should be from food. A lot of the foods that contain water are fruits. Fruits can keep you hydrated, and they can be a joy to eat because they are often super refreshing, and several options are available during the summer season.

Here are some tips to help make sure that your sweat is effective:

- Wear appropriate clothing that allows for air to circulate around your body, and for your sweat to evaporate and wick heat away.
- Wear lighter colors. Dark colors absorb heat under bright light (e.g. sunlight).
- Wear clothes made of natural fibers, such as cotton. Materials such as polyester do not breathe as well and trap heat against the body.
